ONE HR

Getting your company on OneHR - the manual.

Everything in plain words: how to set the company up, bring your people in, run attendance and leave, and press one button at month end for salaries. Written for the person who will actually do it - no software language.

SET UP IN 5 DAYS · WEB CONSOLE + PHONE APP

CONTENTS

The road from Excel to your first one-click salary run

Follow the chapters in order the first time - each one stands on the previous. After go-live you will only ever open chapters 6 to 9; the rest is a one-time setup.

1	Signing in - the console and the app	Your two doors into OneHR
2	Day 1 - Set up the company	Company, locations & geofence, departments, shifts, holidays
3	Day 2 - Bring your people in	Add or import employees, salary structure, who reports to whom
4	Day 3 - Give everyone the app	Logins, roles, what each person sees
5	Day 4-5 - Watch a live day	Punches coming in, fixing misses, approving what waits
6	Attendance, every day	Slide to punch, machines, corrections, the muster
7	Leave that runs itself	Types and balances, applying, approving
8	Month end - payroll in one click	Process, check, approve, payslips, bank file, books
9	PF, ESI, PT, TDS - the paperwork	Registers, return files, Form 16
10	Everyday extras	Notices, Ask HR, assets, timesheets, expenses, letters
11	Go-live checklist	Tick these before the first real salary run

One promise before you start: nothing in OneHR needs to be typed twice. If you find yourself entering the same thing in two places, stop - there is a button that does it, and we will show you where. Call us instead of fighting it.

CHAPTER 1

Signing in - the console and the app

OneHR has two doors. The **web console** on a computer is for the owner and HR - the whole company at a glance. The **phone app** is for everyone - each person carries their own attendance, payslips and leave in their pocket.

1 Open the console

On your computer, open the OneHR link we give you at handover and keep it bookmarked. It works in any browser - nothing to install.

2 Sign in with your admin email

Your email and password are created for you on day one. The first person is always an **Admin** - admins see everything.

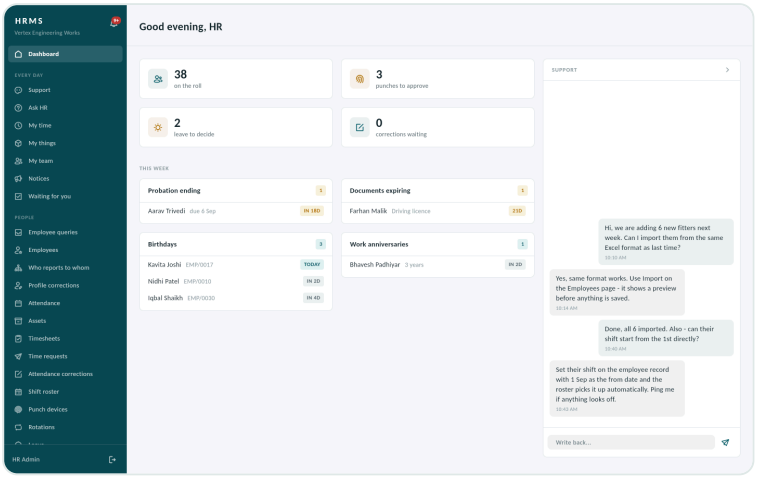

3 Install the app on your phone

We send an install link. Staff sign in with their own email and the starting password you choose; the app asks them to change it.

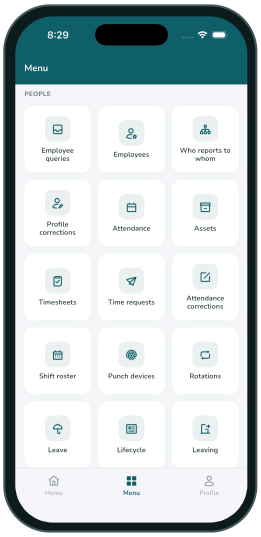

4 Look at the dashboard

Who is on the roll, punches waiting for you, leaves to decide, birthdays, documents about to expire - the day, on one screen.

- **Forgot password?** The sign-in screen has a reset link - it emails a code.
- **Wrong person seeing too much?** That is a role problem - chapter 4 fixes it in one minute.

The console dashboard - the whole company on one screen, with the support chat on the right.

The phone app's menu - the same system, in every pocket.

GOOD TO KNOW

Owner on the phone too?
Yes - your login works in the app as well, with your approvals and the day's numbers.

Do employees need a computer?
Never. For them the phone is the whole system.

Whose data is it?
Yours. Every company's data is separate, backed up, and exportable whenever you ask.

Where is what: everything on the console is in the left menu, grouped the same way this manual is - People, Attendance, Leave, Payroll, Masters. The phone app keeps the same names, so what you learn once works in both places.

CHAPTER 2

Day 1 - Set up the company

One sitting, about two hours, and you never touch most of this again. Do it in this order - each step feeds the next.

1 Company details

Open **Companies** and fill the legal name, address, PAN, PF and ESI codes. These print on payslips and returns, so copy them from your registration papers, not from memory.

2 Locations and the geofence

Add each office, plant or site with its address. Drop the pin on the gate and set the circle - punches inside the circle count as at work; punches outside wait for a manager's OK.

3 Departments, designations, grades

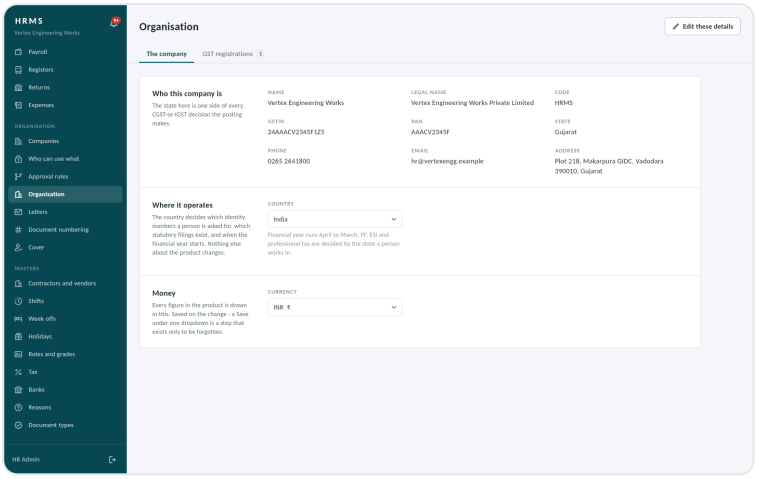

In **Organisation**, list your departments (Accounts, Production...), the designations under them, and pay grades if you use them. Keep the names your people already say out loud.

4 Shifts and week-offs

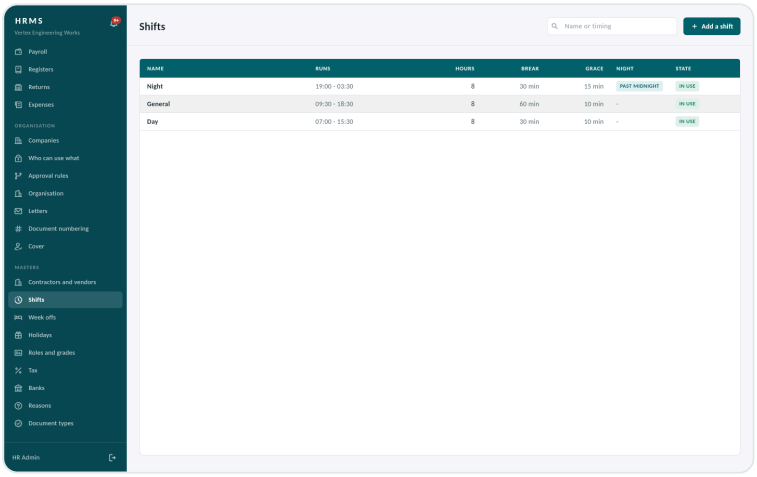

In **Shifts**, set the timings - general shift, night shift, whatever you run - with grace minutes and half-day rules. Pick the weekly off pattern (Sunday, or rotating).

5 The holiday list

In **Holidays**, tick the year's holidays. Attendance and salary both read this list - a day marked here is never counted absent.

Organisation - departments, designations and grades in one place.

Shifts - timings, grace and half-day rules.

GOOD TO KNOW

Two companies in the family?
Add both - one login switches between them, each with its own people and payroll.

Shifts that cross midnight?
Handled - the day belongs to the shift that started it, so night workers never lose a day.

Second-and-fourth Saturday off?
Week-off patterns cover it, including rotating offs.

Already seeded for you: PF and ESI rates, gratuity and bonus rules, leave types, letter templates, account heads and document numbering all come pre-filled with the standard Indian values. You change them only if your company does something different.

CHAPTER 3

Day 2 - Bring your people in

Two ways: type them one by one, or hand us your existing Excel and import the lot. Most companies do the import and then only ever add joiners one at a time.

1

Import from your Excel

In **Employees**, choose Import. Upload the sheet you already keep - it shows a preview and points at anything it cannot read BEFORE saving, so a bad row never gets in.

2

Or add one person

New joiner? **Employees → Add**. Name, department, designation, joining date, shift, location. Ten fields gets a person working; the rest can come later.

3

Salary structure

On the employee's Pay tab, enter the CTC or the in-hand you agreed. OneHR splits it into basic, HRA and allowances by your rules and shows the take-home right there - check it against the offer letter once.

4

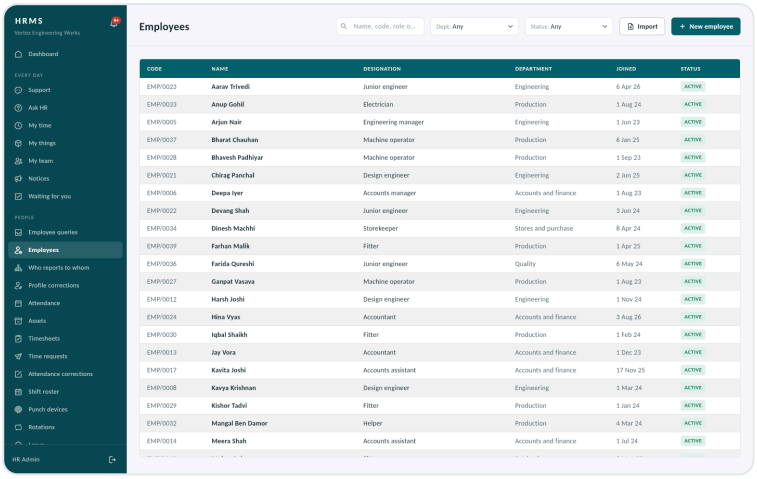

Bank and statutory details

Account number and IFSC (the bank file needs them), PAN, and UAN/ESI numbers if they exist. Missing PAN just means higher TDS - the system handles it, but tell the person.

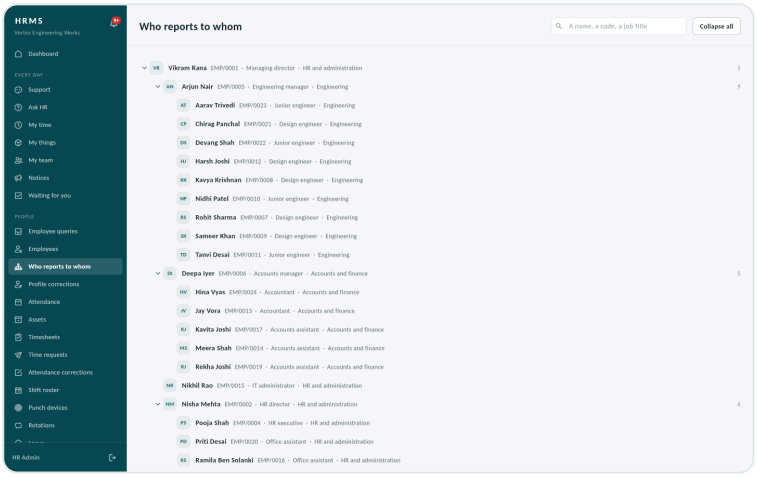

5

Who reports to whom

Set each person's manager. This one field drives approvals everywhere - leave, outside punches, corrections all go to the right person because of it.

The employee list - search, filter, import; every person is a card you can open.

Who reports to whom - the company as a tree, drawn from that one field.

GOOD TO KNOW

Who can see salaries?
Only Admin and HR roles. Managers see attendance and leave, never pay.

Keep our old employee codes?
Yes - the import keeps the codes your people already know.

Contract workers?
Bring them in like anyone else and mark the contractor - musters can split by contractor.

We do this with you. The import of your existing sheets is part of onboarding - you send the Excel, we map it, you check twenty names at random. Half a day, done.

CHAPTER 4

Day 3 - Give everyone the app

Every employee gets a login. What they SEE depends on their role - a fitter sees his own things, his manager also sees the team, HR sees everyone, you see everything.

1 Create the logins

In **Access**, every employee with an email can be given a login in one click - or in bulk. Set one starting password; the app forces a change on first sign-in.

2 Pick roles

Admin - everything. **HR** - people, attendance, leave, payroll. **Manager** - own team's approvals and attendance. **Employee** - own things only. That is all you need on day one.

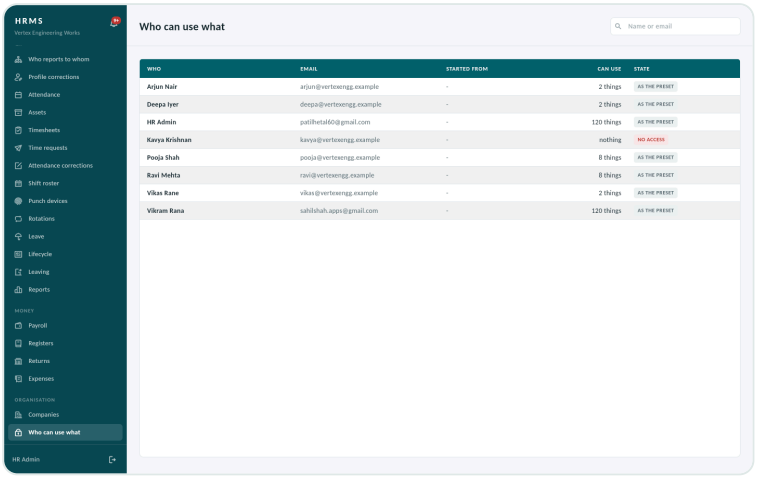

3 Send the install link

Share the app link on your staff WhatsApp group. Each person installs, signs in, and lands on their own home - punch, payslips, leave, in their own pocket.

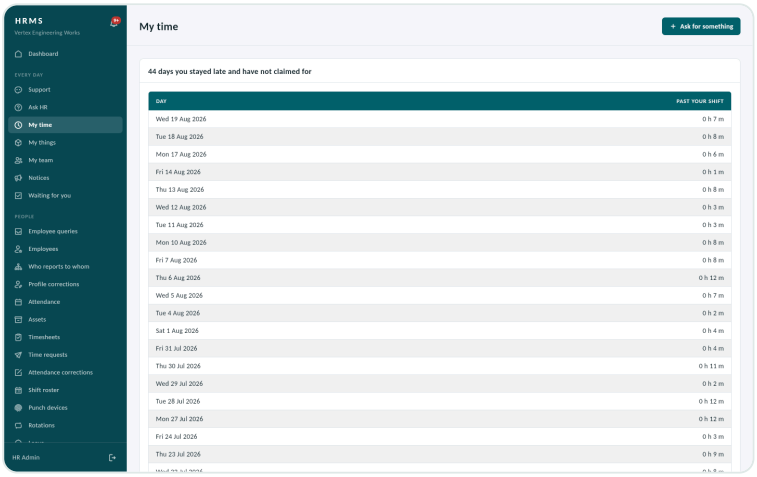

4 Try one person end to end

Take one friendly employee: they punch in at the gate, apply a leave, open a payslip. Five minutes, and you know the whole chain works.

- **No email? No problem.** Workers without email can stay off the app - the punch machine and HR's screens cover them completely.
- **Someone leaves?** Their login closes the day HR marks the exit. Nothing to remember.

Access - one row per person: login, role, active or not.

What an employee sees - their own time, nothing else.

GOOD TO KNOW

Can one person be two things?
A manager needs no special role - anyone with people reporting to them gets the team screens automatically.

Lost or changed phone?
Sign in on the new phone and the old session closes by itself. Nothing to deactivate.

Can someone share a password?
Sharing does not help - every punch needs the person's own face and location.

The rule of thumb: when someone says "I can't see it", it is always the role. Open Access, look at their row, fix the role - done.

CHAPTER 5

Day 4-5 - Watch a live day

Run one or two real days alongside your old register. This is where you and the system learn to trust each other.

1

Morning - watch punches arrive

Open **Attendance** around 10am. Every phone punch and machine punch of the morning is already there, with the photo and the distance from the gate.

2

See what waits for you

The dashboard's "Punches to approve" are the ones made OUTSIDE the fence - a delivery, a site visit, or someone trying it on from home. Look at the photo and the map point, approve or refuse.

3

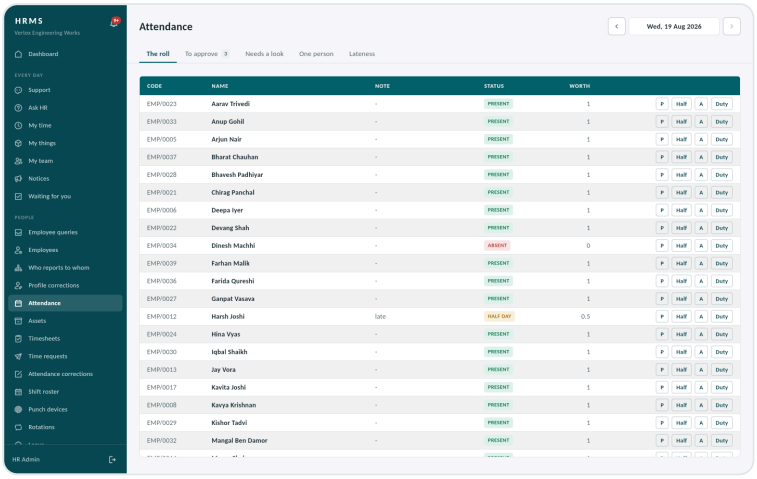

Evening - compare with the register

Pull up the day in Attendance and hold it against your paper register. They should match to the person. Where they differ, the system usually knows something the register missed.

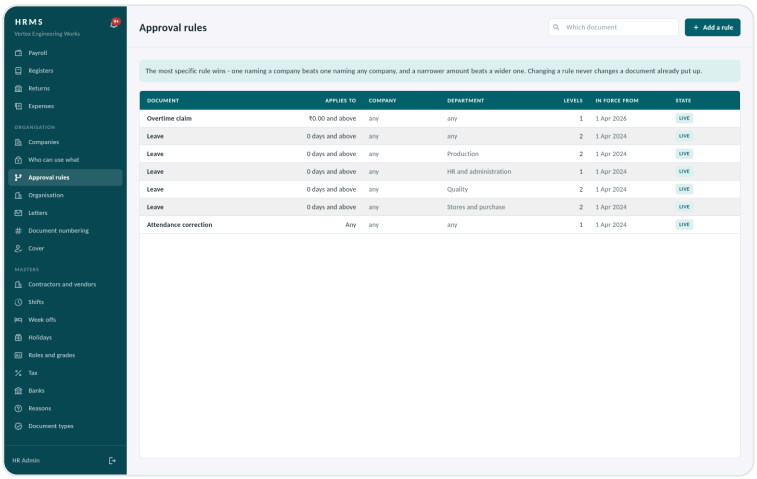

4

Fix the misses properly

Someone forgot to punch out? They send a correction from their phone with a reason; their manager approves; the day heals. Nobody edits the record directly - every change has a name on it.

The attendance day - everyone's in and out, colour-coded, with the open days flagged.

Approvals - everything waiting for a decision, in one queue.

GOOD TO KNOW

People on field duty all day?
Their punches record wherever they are and wait for the manager, each with the photo and the map point.

Machine and phone both?
Both land in the same day for the same person - never counted twice.

A day still looks wrong?
Trace it: open the day, see every punch behind it. The answer is always in the punches.

By the end of day 5 the register and the screen will agree, and you can stop keeping the register. Most companies stop by day 3.

CHAPTER 6

Attendance, every day

After go-live, attendance mostly runs itself. Here is the whole machine in one page.

1

Slide to punch

The employee opens My attendance and slides the button at the bottom. The phone takes a selfie and the location in one motion - inside the fence it counts immediately; outside it records and waits for the manager.

2

Punch machines too

Already have a fingerprint or card machine at the gate? Its file imports in **Punch devices** - both sources land in the same day, no double counting.

3

Shift roster and rotations

Weekly rotating shifts? Set the pattern once in **Rotations** and the roster fills itself forward. One-off changes are a drag on the roster screen.

4

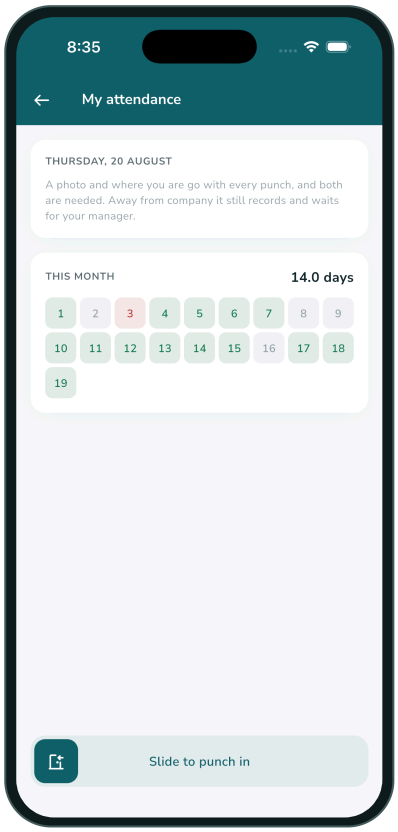

Corrections, with a paper trail

Missed punches are healed by request and approval - never by silent editing. Months later you can still see who fixed what and why.

5

The muster, always ready

The attendance register the inspector asks for is a download, not a preparation. It is simply what already happened.

My attendance on the phone - the month at a glance, slide to punch at the bottom.

GOOD TO KNOW

No internet at the gate?
The punch records offline and sends itself when the phone finds network again.

Half days?
The shift's own rules decide full day, half day or absent from the hours - nobody judges it by hand.

Overtime?
Extra hours show on the day and flow into salary by whatever OT rule you set.

Why the photo? So a punch is always the person's own. Buddy punching - the oldest trick in every factory - simply stops working.

CHAPTER 7

Leave that runs itself

Balances that are always right, requests that go to the right person, and salary that already knows - without HR carrying any of it in their head.

1 **The leave types are ready**

Casual, sick, earned, comp-off and leave-without-pay come set up with standard rules - yearly quota, carry-forward, half-days. Change the numbers to your policy in **Leave → Types** once.

2 **Applying takes a minute**

The employee picks dates and a reason on their phone and sees their balance right there. No forms, no walking to the office.

3 **The manager decides on the phone**

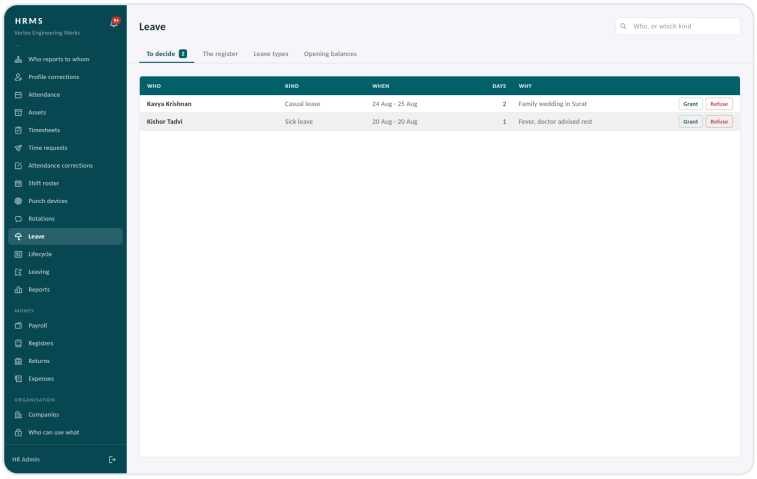

The request lands in the manager's Approvals with the team calendar behind it - who else is off that week is one glance away. Approve or refuse with a note.

4 **Salary already knows**

An approved leave-without-pay shows up as a deduction at month end by itself. An approved sick day never gets counted absent. Nobody reconciles anything.

5 **Encashment and comp-offs**

Extra days worked can become comp-offs that expire by your rule; unused earned leave encashes at year end - both automatic.

Leave on the console - balances, requests and the year, per person.

GOOD TO KNOW

Can HR apply for someone?

Yes - HR can raise a leave on a person's behalf from the console; it still goes through the same approval.

Half-day leave?

Leave types that allow half days offer the choice while applying.

Year end?

Carry-forward and lapse run by each type's rule on the 1st of January - or April, as you set it.

The balance argument is over. The number the employee sees on their phone is the same number HR sees. There is only one truth, so there is nothing to argue about.

CHAPTER 8

Month end - payroll in one click

The chapter you bought the product for. What used to be three days of Excel is four steps, and only one of them takes longer than a minute.

1

Process the month

In **Payroll**, pick the month and press Process. Attendance, approved leave, joiners mid-month, leavers mid-month, overtime - everything it needs it already has. A minute later every payslip is drafted.

2

Check the summary

The month screen shows every person's gross, deductions and net beside last month's - anything unusual stands out by itself. Open any row to see the full payslip with every line explained.

3

Approve

Happy? Approve the run. Payslips lock and appear on every employee's phone the same moment. Not happy? Fix the cause - a missed punch, a leave - and re-process. Nothing is final until you approve.

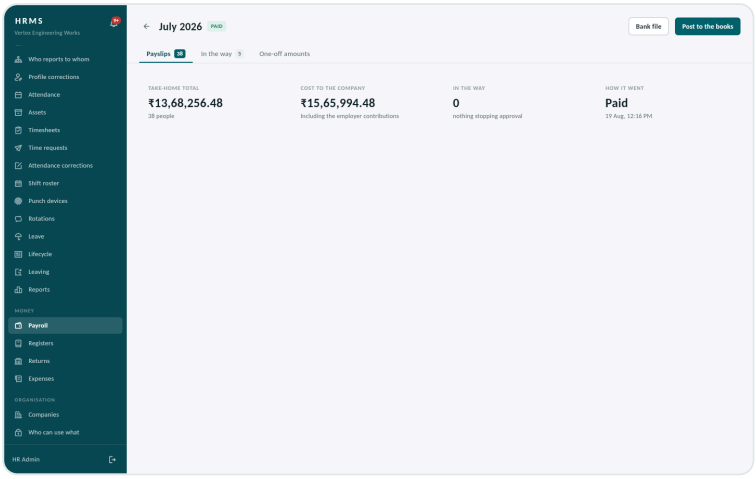

4

Pay and post

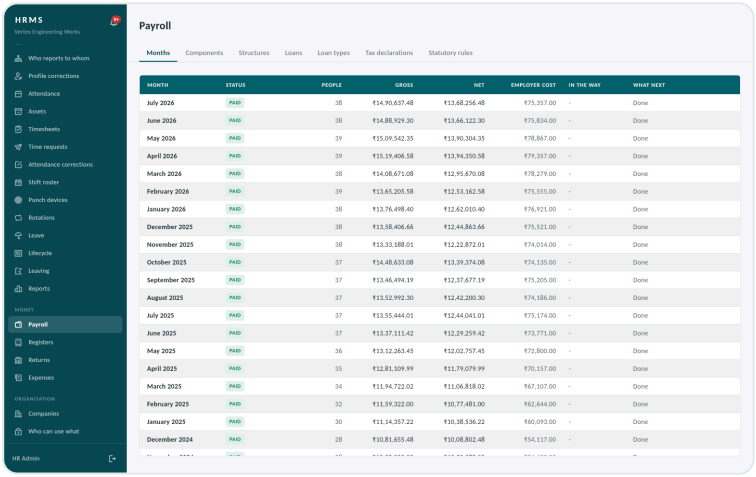

Download the

bank file

and upload it to your net banking - every account paid in one go. The salary entry posts itself into the books with PF, ESI, PT and TDS all on their own heads.

A processed month - every person, every rupee, one screen before you approve.

Payroll, month by month - the year's runs with their status.

GOOD TO KNOW

Joined on the 20th?
Paid exactly for the days, with PF, ESI and TDS pro-rated - no manual working.

Cash-paid workers?
They stay out of the bank file automatically and show on their own list.

Mistake found after approving?
Fix the cause and re-run the month before paying - or adjust next month; both leave a clean trail.

Audited to the rupee: this engine has been run over simulated multi-year company histories - joiners on the 20th, leavers in 13 days, unpaid leave, night shifts, arrears - and every payslip traced back to punches by hand. That is the confidence behind the one click.

CHAPTER 9

PF, ESI, PT, TDS - the paperwork

Every register and return file the inspector or the consultant asks for, generated from the payroll that already ran. You never prepare them - you download them.

1

Registers

In **Registers** : the wage register, muster, PF and ESI registers, PT summary, bonus and gratuity workings - each one a download for any month or year.

2

Return files

In **Returns** : the PF ECR file and ESI return file in the exact format the government portals take. Download, upload, done - your consultant will ask what happened to you.

3

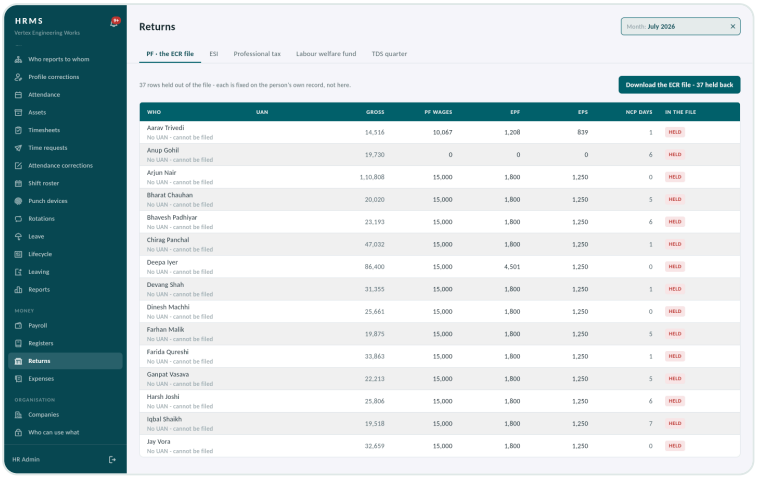

TDS through the year

Each person's tax spreads over the year by their declared regime and investments. Declarations happen on their own phone in **My tax** - HR never collects paper proofs into a folder again.

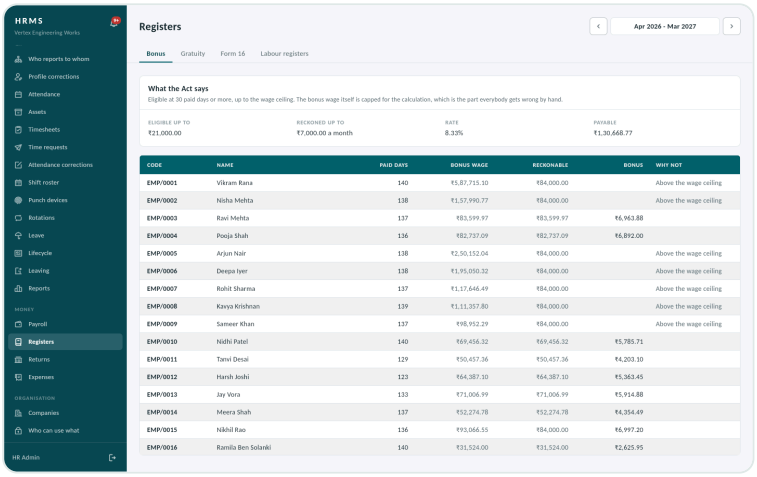

4

Form 16 at year end

One button per person, a proper signed-format PDF drawn from the payslips that actually happened - quarter by quarter TDS included.

Returns - the PF and ESI files in portal format, per month.

Registers - the inspector's whole list, each one a download.

GOOD TO KNOW

Which PT slab applies?

The slab of the state each employee works in - multi-state companies just work.

Form 16 lost?

Download it again any time - it renders fresh from the same payslips.

New financial year?

Opens itself with the first April payroll. Numbering, TDS and registers all move over on their own.

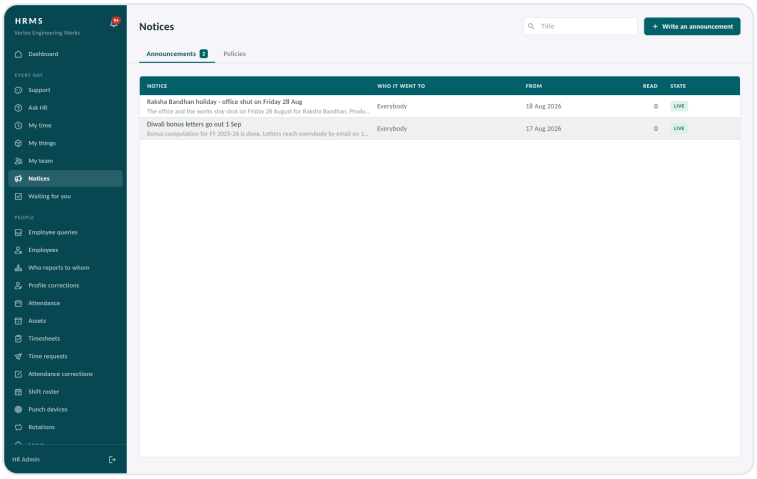

The day the inspector visits you open Registers, print three PDFs, and pour the tea. That is the whole preparation.

CHAPTER 10

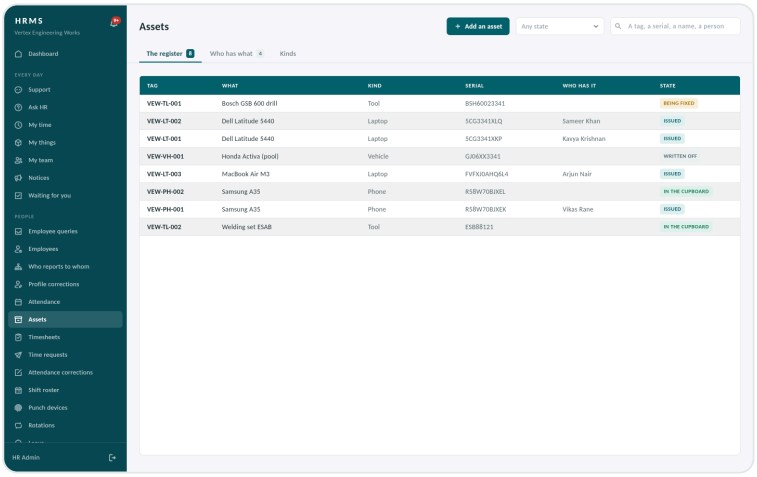

Everyday extras

Around the big four - people, attendance, leave, salary - a set of small tools that quietly remove the rest of HR's busywork.

- **Notices** - publish once, lands on every phone. Holiday circulars, policy notes, the works outing. No more printouts by the lift.
- **Ask HR** - employees raise questions from the app ("when does my probation end?") and HR answers from a queue instead of being stopped in the corridor.
- **Assets** - who is holding which laptop, phone or tool, in one register. Issue, transfer, return with condition noted; exit clearance reads it automatically.
- **Timesheets** - where teams bill hours to jobs, people fill the week on the phone and managers approve; hours flow to reports.
- **Expenses** - claims with the bill photographed, approved on the phone, settled with salary or separately.
- **Letters** - offer, appointment, increment, experience letters from your templates, filled with the employee's own details in one click.
- **Lifecycle** - probation ending alerts, confirmations, appraisals due, exit and full-and-final with every recovery and dues line on one page.

Notices - publish once, reaches everyone.

Assets - the company's things and whose hands they are in.

GOOD TO KNOW

Do the extras cost more?

No - every module is inside the same price. There are no add-ons to buy later.

Will unused modules clutter the app?

No - what a person cannot use, they do not see.

You do not have to use all of this on day one. Attendance, leave and payroll are the spine; switch the extras on one at a time whenever a pain shows up. They are already there, at no extra cost.

CHAPTER 11

The go-live checklist

Before the first REAL salary run, walk this list top to bottom. Fifteen minutes, and month end becomes boring forever - which is exactly what month end should be.

1 **Company papers in**
PAN, PF code, ESI code entered and spelled the way they are registered.

2 **Every location fenced**
Stand at each gate and punch once yourself - it should count without a question.

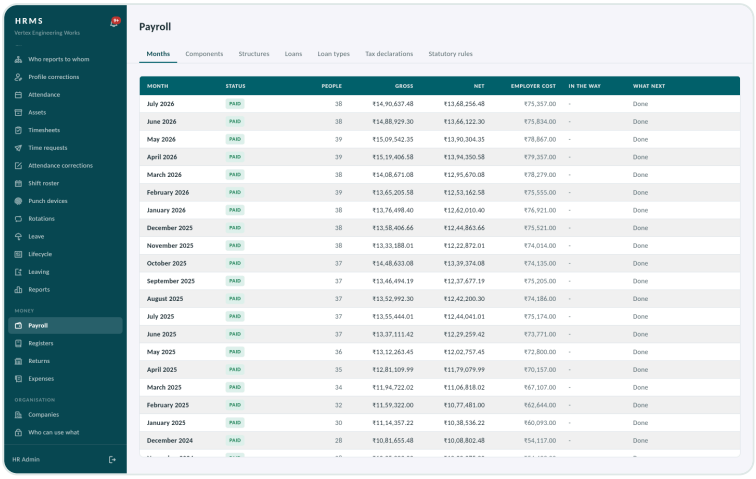

3 **Headcount matches**
The number of active employees equals the number of people you actually pay. Not one more, not one less.

4 **Twenty spot checks**
Open twenty people at random: joining date, salary, bank account, manager. Right? The import is right.

5 **Everyone can punch**
Every app user has punched at least once; the machine file has imported at least once.

6 **One parallel month**
Run OneHR beside your old Excel for one salary. Compare the totals. When they agree - and they will - retire the Excel.

7 **Managers know their one job**
Approvals come to their phone; deciding them daily is all OneHR ever asks of a manager.

Payroll, month by month - after go-live this screen is your month end.

GOOD TO KNOW

Who does go-live with us?
We do - hand in hand, on calls or in person, through the first salary run.

How much training?
About an hour for HR and the owner. Employees need none - punch and payslips explain themselves.

And after go-live? Your whole month is: watch the dashboard, decide what waits for you, press Process on the 1st. Everything else in this manual happens by itself.

Stuck anywhere in this manual?
Message us. A person answers.
